Scan Report

December 21, 2025

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “Immediate scan of IP 192.168.44.130”. The scan started at Sun Dec 21 07:55:16 2025 UTC and ended at Sun Dec 21 08:43:24 2025 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1 Result Overview

Host	High	Medium	Low	Log	False Positive
192.168.44.130	11	40	6	0	0
Total: 1	11	40	6	0	0

Vendor security updates are not trusted.
Overrides are off. Even when a result has an override, this report uses the actual threat of the result.
Information on overrides is included in the report.
Notes are included in the report.
This report might not show details of all issues that were found.
Issues with the threat level “Log” are not shown.
Issues with the threat level “Debug” are not shown.
Issues with the threat level “False Positive” are not shown.
Only results with a minimum QoD of 70 are shown.

This report contains all 72 results selected by the filtering described above. Before filtering there were 564 results.

1.1 Host Authentications

Host	Protocol	Result	Port/User
192.168.44.130	SMB	Success	Protocol SMB, Port 445, User

2 Results per Host

NVT: FTP Brute Force Logins With Default Credentials Reporting

Summary
It was possible to login into the remote FTP server using weak/known credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

```
It was possible to login with the following credentials <User>:<Password>
msfadmin:msfadmin
postgres:postgres
service:service
user:user
```

Impact
This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:
Solution type: Mitigation
Change the password as soon as possible.

Vulnerability Insight
The following devices are / software is known to be affected:

... continues on next page ...

. . . continued from previous page . . .

- CVE-2001-1594: Codonics printer FTP service as used in GE Healthcare eNTEGRA P&R
- CVE-2013-7404: GE Healthcare Discovery NM 750b
- CVE-2014-9198: Schneider Electric ETG3000 FactoryCast HMI gateways
- CVE-2015-7261: QNAP iArtist Lite distributed with QNAP Signage Station
- CVE-2016-8731: Foscam C1 devices
- CVE-2017-8218: vsftpd on TP-Link C2 and C20i devices
- CVE-2018-9068: IMM2 for IBM and Lenovo System x
- CVE-2018-17771: Ingenico Telium 2 PoS terminals
- CVE-2018-19063, CVE-2018-19064: Foscam C2 and Opticam i5 devices

Note: As the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Method

Reports weak/known credentials detected by the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717).
Details: `FTP Brute Force Logins With Default Credentials Reporting`
OID:1.3.6.1.4.1.25623.1.0.108718
Version used: `2025-05-13T05:41:39Z`

2.1.2 High 514/tcp

High (CVSS: 7.5)

NVT: rsh Unencrypted Cleartext Login

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

This remote host is running a rsh service.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The rsh service is misconfigured so it is allowing connections without a passwor
↪d or with default root:root credentials.
```

Solution:

Solution type: Mitigation

Disable the rsh service and use alternatives like SSH instead.

Vulnerability Insight

rsh (remote shell) is a command line computer program which can execute shell commands as another user, and on another computer across a computer network.

Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.

Vulnerability Detection Method

Details: `rsh Unencrypted Cleartext Login`

OID:1.3.6.1.4.1.25623.1.0.100080

Version used: `2021-10-20T09:03:29Z`

References

`cve: CVE-1999-0651`

[return to 192.168.44.130]

2.1.3 High 513/tcp

High (CVSS: 7.5)

NVT: The rlogin service is running

Summary

This remote host is running a rlogin service.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The rlogin service is running on the target system.
```

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: Mitigation
Disable the rlogin service and use alternatives like SSH instead.

Vulnerability Insight
rlogin has several serious security problems,
- all information, including passwords, is transmitted unencrypted.
- .rlogin (or .rhosts) file is easy to misuse (potentially allowing anyone to login without a password)

Vulnerability Detection Method
Details: `The rlogin service is running`
OID:1.3.6.1.4.1.25623.1.0.901202
Version used: `2025-03-05T05:38:53Z`

```

Impact

This issue may be exploited by a remote attacker to gain access to sensitive information or modify system configuration.

Solution:

Solution type: Workaround

Change the password of the affected account(s).

Vulnerability Detection Method

Tries to login using known default credentials.

Note: The default 'admin' and 'user' credentials might be also reported for non-Riello devices. This result is currently expected.

Details: `Riello NetMan 204 Default Credentials (SSH)`

OID:1.3.6.1.4.1.25623.1.0.140001

Version used: `2025-04-15T05:54:49Z`

2.1.6 High 5432/tcp

High (CVSS: 7.4)

NVT: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability

Summary
OpenSSL is prone to a security bypass vulnerability.

Quality of Detection (QoD): 70%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successfully exploiting this issue may allow attackers to obtain sensitive information by conducting a man-in-the-middle attack. This may lead to other attacks.

Solution:
Solution type: VendorFix
Updates are available. Please see the references for more information.

Affected Software/OS
OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m and 1.0.1 before 1.0.1h.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight

OpenSSL does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle attackers to trigger use of a zero-length master key in certain OpenSSL-to-OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the 'CCS Injection' vulnerability.

Vulnerability Detection Method

Send two SSL ChangeCipherSpec request and check the response.

[return to 192.168.44.130]

2.1.7 High 1099/tcp

High (CVSS: 7.5)

NVT: Java RMI Server Insecure Default Configuration RCE Vulnerability - Active Check

Summary
Multiple Java products that implement the RMI Server contain a vulnerability that could allow an unauthenticated, remote attacker to execute arbitrary code (remote code execution/RCE) on a targeted system with elevated privileges.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

```
By doing an RMI request it was possible to trigger the vulnerability and make th
↪e remote host sending a request back to the scanner host (Details on the recei
↪ved packet follows).
Destination IP:   192.168.44.128 (receiving IP on scanner host side)
Destination port: 27603/tcp (receiving port on scanner host side)
Originating IP:   192.168.44.130 (originating IP from target host side)
```

Impact
An unauthenticated, remote attacker could exploit the vulnerability by transmitting crafted packets to the affected software. When the packets are processed, the attacker could execute arbitrary code on the system with elevated privileges.

Solution:
Solution type: Workaround
Disable class-loading. Please contact the vendor of the affected system for additional guidance.

Vulnerability Insight
The vulnerability exists because of an incorrect default configuration of the Remote Method Invocation (RMI) Server in the affected software.

Vulnerability Detection Method
Sends a crafted JRMI request and checks if the target is connecting back to the scanner host.
Note: For a successful detection of this flaw the target host needs to be able to reach the scanner host on a TCP port randomly generated during the runtime of the VT (currently in the range of 10000-32000).
Details: `Java RMI Server Insecure Default Configuration RCE Vulnerability - Active Check`

2.1.8 High 80/tcp

High (CVSS: 7.5)

NVT: Test HTTP dangerous methods

. . . continues on next page . . .

. . . continued from previous page . . .

Summary

Misconfigured web servers allows remote clients to perform dangerous HTTP methods such as PUT and DELETE.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
We could upload the following files via the PUT method at this web server:
http://192.168.44.130/dav/puttest1321165363.html
We could delete the following files via the DELETE method at this web server:
http://192.168.44.130/dav/puttest1321165363.html
```

Impact

- Enabled PUT method: This might allow an attacker to upload and run arbitrary code on this web server.
- Enabled DELETE method: This might allow an attacker to delete additional files on this web server.

Solution:

Solution type: Mitigation

Use access restrictions to these dangerous HTTP methods or disable them completely.

Affected Software/OS

Web servers with enabled PUT and/or DELETE methods.

Vulnerability Detection Method

Checks if dangerous HTTP methods such as PUT and DELETE are enabled and can be misused to upload or delete files.

Details: `Test HTTP dangerous methods`

OID:1.3.6.1.4.1.25623.1.0.10498

NVT: EasyPHP Webserver <= 12.1 Multiple Vulnerabilities - Active Check

Summary

EasyPHP Webserver is prone to multiple vulnerabilities.

Quality of Detection (QoD): 99%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Vulnerable URL: http://192.168.44.130/phpinfo.php
Concluded from:
  <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NOARCHIV
↪E" /></head>
  <tr><td class="e">Configuration File (php.ini) Path </td><td class="v">/etc/ph
↪p5/cgi </td></tr>
  <h2>PHP Core</h2>
  <h2>PHP Variables</h2>
```

Impact

Successful exploitation will allow attackers to gain administrative access, disclose the information, inject PHP code/shell and execute a remote PHP Code.

Solution:

Solution type: WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

EasyPHP version 12.1 and prior.

Vulnerability Insight

The bug in EasyPHP WebServer Manager, its skipping authentication for certain requests. Which allows to bypass the authentication, disclose the information or execute a remote PHP code.

Vulnerability Detection Method

Sends a crafted HTTP GET request and checks the response.

Note: It is currently expected that a result of this VT is reported if the system is generally exposing a phpinfo() output on the relevant URL / endpoint (independent from the running product). Exposing such sensitive information is generally seen as a security misconfiguration and should be avoided.

Details: `EasyPHP Webserver <= 12.1 Multiple Vulnerabilities - Active Check`

2.1.9 High 6697/tcp

High (CVSS: 8.1)

NVT: UnrealIRCd Authentication Spoofing Vulnerability

Summary
UnrealIRCd is prone to authentication spoofing vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 3.2.8.1
Fixed version:     3.2.10.7
```

Impact
Successful exploitation of this vulnerability will allows remote attackers to spoof certificate fingerprints and consequently log in as another user.

Solution:
Solution type: VendorFix
Upgrade to UnrealIRCd 3.2.10.7, or 4.0.6, or later.

Affected Software/OS
UnrealIRCd before 3.2.10.7 and 4.x before 4.0.6.

Vulnerability Insight
The flaw exists due to an error in the 'm_authenticate' function in 'modules/m_sasl.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `UnrealIRCd Authentication Spoofing Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.809883
Version used: `2023-07-14T16:09:27Z`

High (CVSS: 7.5)

NVT: UnrealIRCd Backdoor

Summary
Detection of backdoor in UnrealIRCd.

Quality of Detection (QoD): 70%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Solution:
Solution type: VendorFix
Install latest version of unrealircd and check signatures of software you're installing.

Affected Software/OS
The issue affects Unreal 3.2.8.1 for Linux. Reportedly package Unreal3.2.8.1.tar.gz downloaded in November 2009 and later is affected. The MD5 sum of the affected file is 752e46f2d873c1679fa99de3f52a274d. Files with MD5 sum of 7b741e94e867c0a7370553fd01506c66 are not affected.

Vulnerability Insight
Remote attackers can exploit this issue to execute arbitrary system commands within the context of the affected application.

Vulnerability Detection Method
Details: `UnrealIRCd Backdoor`
OID:1.3.6.1.4.1.25623.1.0.80111
Version used: `2025-03-21T05:38:29Z`

[return to 192.168.44.130]

2.1.10 Medium 2121/tcp

Medium (CVSS: 4.8)

NVT: FTP Unencrypted Cleartext Login

Summary
The remote host is running a FTP service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The remote FTP service accepts logins without a previous sent 'AUTH TLS' command
↪. Response(s):
Non-anonymous sessions: 331 Password required for openvasvt
Anonymous sessions:     331 Password required for anonymous
```

Impact
An attacker can uncover login names and passwords by sniffing traffic to the FTP service.

Solution:
Solution type: Mitigation
Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.

Vulnerability Detection Method
Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.
Details: `FTP Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.108528
Version used: `2023-12-20T05:05:58Z`

[return to 192.168.44.130]

2.1.11 Medium 22/tcp

Medium (CVSS: 5.3)

NVT: Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)

Summary
The remote SSH server is configured to allow / support weak key exchange (KEX) algorithm(s).

Quality of Detection (QoD): 80%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
The remote SSH server supports the following weak KEX algorithm(s):
KEX algorithm                      | Reason
-------------------------------------------------------------------------------
↪-----------
diffie-hellman-group-exchange-sha1 | Using SHA-1
diffie-hellman-group1-sha1         | Using Oakley Group 2 (a 1024-bit MODP group
↪) and SHA-1
```

Impact

An attacker can quickly break individual connections.

Solution:

Solution type: Mitigation

Disable the reported weak KEX algorithm(s)

- 1024-bit MODP group / prime KEX algorithms:

Alternatively use elliptic-curve Diffie-Hellmann in general, e.g. Curve 25519.

Vulnerability Insight

- 1024-bit MODP group / prime KEX algorithms:

Millions of HTTPS, SSH, and VPN servers all use the same prime numbers for Diffie-Hellman key exchange. Practitioners believed this was safe as long as new key exchange messages were generated for every connection. However, the first step in the number field sieve-the most efficient algorithm for breaking a Diffie-Hellman connection-is dependent only on this prime.

A nation-state can break a 1024-bit prime.

Vulnerability Detection Method

Checks the supported KEX algorithms of the remote SSH server.

Currently weak KEX algorithms are defined as the following:

- non-elliptic-curve Diffie-Hellmann (DH) KEX algorithms with 1024-bit MODP group / prime
- ephemerally generated key exchange groups uses SHA-1
- using RSA 1024-bit modulus key

Details: Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)

OID:1.3.6.1.4.1.25623.1.0.150713

Version used: 2024-06-14T05:05:48Z

NVT: Weak Host Key Algorithm(s) (SSH)

Summary
The remote SSH server is configured to allow / support weak host key algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSH server supports the following weak host key algorithm(s):
host key algorithm | Description
-------------------------------------------------------------------------------
↪---------
ssh-dss            | Digital Signature Algorithm (DSA) / Digital Signature Stand
↪ard (DSS)
```

Solution:
Solution type: Mitigation
Disable the reported weak host key algorithm(s).

Vulnerability Detection Method
Checks the supported host key algorithms of the remote SSH server.
Currently weak host key algorithms are defined as the following:
- ssh-dss: Digital Signature Algorithm (DSA) / Digital Signature Standard (DSS)

Details: `Weak Host Key Algorithm(s) (SSH)`
OID:1.3.6.1.4.1.25623.1.0.117687
Version used: `2024-06-14T05:05:48Z`

References
url: https://www.rfc-editor.org/rfc/rfc8332

Medium (CVSS: 4.3)

NVT: Weak Encryption Algorithm(s) Supported (SSH)

Summary
The remote SSH server is configured to allow / support weak encryption algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSH server supports the following weak client-to-server encryption al
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
↪gorithm(s):
3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se
The remote SSH server supports the following weak server-to-client encryption al
↪gorithm(s):
3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se
```

Solution:
Solution type: Mitigation
Disable the reported weak encryption algorithm(s).

Vulnerability Insight
- The 'arcfour' cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.
- The 'none' algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.
- A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method
Checks the supported encryption algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak encryption algorithms are defined as the following:
- Arcfour (RC4) cipher based algorithms
- 'none' algorithm
- CBC mode cipher based algorithms
Details: `Weak Encryption Algorithm(s) Supported (SSH)`
OID:1.3.6.1.4.1.25623.1.0.105611

[return to 192.168.44.130]

2.1.12 Medium 21/tcp

Medium (CVSS: 6.4)

NVT: Anonymous FTP Login Reporting

Summary

Reports if the remote FTP Server allows anonymous logins.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
It was possible to login to the remote FTP service with the following anonymous
↪account(s):
anonymous:anonymous@example.com
ftp:anonymous@example.com
```

Impact

Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to:

- gain access to sensitive files
- upload or delete files.

Solution:

Solution type: Mitigation

If you do not want to share files, you should disable anonymous logins.

Vulnerability Insight

A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.

. . . continues on next page . . .

. . . continued from previous page . . .

Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.

Vulnerability Detection Method
Details: `Anonymous FTP Login Reporting`
OID:1.3.6.1.4.1.25623.1.0.900600
Version used: `2021-10-20T09:03:29Z`

References
`cve: CVE-1999-0497`

Medium (CVSS: 4.8)

NVT: FTP Unencrypted Cleartext Login

Summary
The remote host is running a FTP service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The remote FTP service accepts logins without a previous sent 'AUTH TLS' command
↪. Response(s):
Non-anonymous sessions: 331 Please specify the password.
Anonymous sessions:     331 Please specify the password.
```

Impact
An attacker can uncover login names and passwords by sniffing traffic to the FTP service.

Solution:
Solution type: Mitigation
Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.

Vulnerability Detection Method
Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.
Details: `FTP Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.108528

[return to 192.168.44.130]

2.1.13 Medium 5432/tcp

Medium (CVSS: 5.9)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary
It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 proto
↪col and supports one or more ciphers. Those supported ciphers can be found in
↪the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020
↪67) VT.
```

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols.
Please see the references for more resources supporting you with this task.

Affected Software/OS
All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight
The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:
- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method
Checks the used SSL protocols of the services provided by this system.
Details: `SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection`

NVT: SSL/TLS: Report Weak Cipher Suites

Summary
This routine reports all weak SSL/TLS cipher suites accepted by a service.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
'Weak' cipher suites accepted by this service via the SSLv3 protocol:
TLS_RSA_WITH_RC4_128_SHA
'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_RSA_WITH_RC4_128_SHA
```

Impact
This could allow remote attackers to obtain sensitive information or have other, unspecified impacts.

Solution:
Solution type: Mitigation
The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.
Please see the references for more resources supporting you with this task.

Affected Software/OS
All services providing an encrypted communication using weak SSL/TLS cipher suites.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight

These rules are applied for the evaluation of the cryptographic strength:
- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808)
- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000)
- 1024 bit RSA authentication is considered to be insecure and therefore as weak
- Any cipher considered to be secure for only the next 10 years is considered as medium
- Any other cipher is considered as strong

Vulnerability Detection Method

Checks previous collected cipher suites.
NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.
Details: `SSL/TLS: Report Weak Cipher Suites`

↪626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for C
↪omplication of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no su
↪ch thing outside US,C=XX (Server certificate)
```

Impact

Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.

Solution:

Solution type: Mitigation

Replace the certificate with a stronger key and reissue the certificates it signed.

Vulnerability Insight

SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.

Vulnerability Detection Method

Checks the RSA keys size of the server certificate and all certificates in chain for a size < 2048 bit.

Details: `SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048.`

Medium (CVSS: 5.0)

NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)

Summary

The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The following indicates that the remote SSL/TLS service is affected:
Protocol Version | Successful re-done SSL/TLS handshakes (Renegotiation) over an
↪ existing / already established SSL/TLS connection
--------------------------------------------------------------------------------
↪------------------------------------------------
TLSv1.0          | 10
```

Impact

. . . continues on next page . . .

... continued from previous page ...

The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.

Solution:
Solution type: VendorFix
Users should contact their vendors for specific patch information.
A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.

Affected Software/OS
Every SSL/TLS service which does not properly restrict client-initiated renegotiation.

Vulnerability Insight
The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols.
Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale:
> It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment.
Both CVEs are still kept in this VT as a reference to the origin of this flaw.

Vulnerability Detection Method
Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection.

NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Summary

It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
The service is only providing the deprecated TLSv1.0 protocol and supports one o
↪r more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report S
↪upported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.
```

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:

Solution type: Mitigation

It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols.

Please see the references for more resources supporting you with this task.

Affected Software/OS

- All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols
- CVE-2023-41928: Kiloview P1 4G and P2 4G Video Encoder
- CVE-2024-41270: Gorush v1.18.4
- CVE-2025-3200: Multiple products from Wiesemann & Theis

Vulnerability Insight

The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:

- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

Vulnerability Detection Method

Checks the used TLS protocols of the services provided by this system.

Details: `SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection`

↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic
↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
↪ng outside US,C=XX
Signature Algorithm:  sha1WithRSAEncryption
```

Solution:

Solution type: Mitigation

Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:

- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.

NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:

Fingerprint1

or

fingerprint1, Fingerprint2

Vulnerability Detection Method

Check which hashing algorithm was used to sign the remote SSL/TLS certificate.

Details: `SSL/TLS: Certificate Signed Using A Weak Signature Algorithm`

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size $<$ 2048).

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Server Temporary Key Size: 1024 bits
```

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:

Solution type: Workaround

- Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task.
- For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Affected Software/OS

All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.

Vulnerability Insight

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: `SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerabili.`

Medium (CVSS: 6.8)

NVT: Multiple Vendors STARTTLS Implementation Plaintext Arbitrary Command Injection Vulnerability

Summary
Multiple vendors' implementations of 'STARTTLS' are prone to a vulnerability that lets attackers inject arbitrary commands.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
An attacker can exploit this issue to execute arbitrary commands in the context of the user running the application. Successful exploits can allow attackers to obtain email usernames and passwords.

Solution:
Solution type: VendorFix
Updates are available. Please see the references for more information.

Affected Software/OS
The following vendors are known to be affected:
Ipswitch
Kerio
Postfix
Qmail-TLS
Oracle
SCO Group
spamdyke
ISC

Vulnerability Detection Method
Send a special crafted 'STARTTLS' request and check the response.
Details: `Multiple Vendors STARTTLS Implementation Plaintext Arbitrary Command Injection .`

Medium (CVSS: 5.9)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary
It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and S
↪SLv3 protocols and supports one or more ciphers. Those supported ciphers can b
↪e found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.256
↪23.1.0.802067) VT.
```

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols.
Please see the references for more resources supporting you with this task.

Affected Software/OS
All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight
The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:
- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method
Checks the used SSL protocols of the services provided by this system.

Medium (CVSS: 5.3)

NVT: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048 bits

Summary
The remote SSL/TLS server certificate and/or any of the certificates in the certificate chain is using a RSA key with less than 2048 bits.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSL/TLS server is using the following certificate(s) with a RSA key w
↪ith less than 2048 bits (public-key-size:public-key-algorithm:serial:issuer):
1024:RSA:00FAF93A4C7FB6B9CC:1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D
↪626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for C
↪omplication of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no su
↪ch thing outside US,C=XX (Server certificate)
```

Impact
Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.

Solution:
Solution type: Mitigation

. . . continues on next page . . .

. . . continued from previous page . . .

Replace the certificate with a stronger key and reissue the certificates it signed.

Vulnerability Insight
SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.

Vulnerability Detection Method
Checks the RSA keys size of the server certificate and all certificates in chain for a size < 2048 bit.
Details: `SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048.`
`↪..`

Medium (CVSS: 5.0)

NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)

Summary
The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The following indicates that the remote SSL/TLS service is affected:
Protocol Version | Successful re-done SSL/TLS handshakes (Renegotiation) over an
↪ existing / already established SSL/TLS connection
--------------------------------------------------------------------------------
↪--------------------------------------------------
TLSv1.0          | 10
```

Impact
The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.

Solution:
Solution type: VendorFix
Users should contact their vendors for specific patch information.
A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

Every SSL/TLS service which does not properly restrict client-initiated renegotiation.

Vulnerability Insight

The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols.

Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale:

> It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment.

Both CVEs are still kept in this VT as a reference to the origin of this flaw.

Vulnerability Detection Method

Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection.

Details: `SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)`

```

Solution:
Solution type: Mitigation
Replace the SSL/TLS certificate by a new one.

Vulnerability Insight

This script checks expiry dates of certificates associated with SSL/TLS-enabled services on the target and reports whether any have already expired.

Vulnerability Detection Method

Details: `SSL/TLS: Certificate Expired`
OID:1.3.6.1.4.1.25623.1.0.103955
Version used: `2024-06-14T05:05:48Z`

Medium (CVSS: 5.0)

NVT: Check if Mailserver answer to VRFY and EXPN requests

Summary

The Mailserver on this host answers to VRFY and/or EXPN requests.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
'VRFY root' produces the following answer: 252 2.0.0 root
```

Solution:

Solution type: Workaround

Disable VRFY and/or EXPN on your Mailserver.
For postfix add 'disable_vrfy_command=yes' in 'main.cf'.
For Sendmail add the option 'O PrivacyOptions=goaway'.
It is suggested that, if you really want to publish this type of information, you use a mechanism that legitimate users actually know about, such as Finger or HTTP.

Vulnerability Insight

VRFY and EXPN ask the server for information about an address. They are inherently unusable through firewalls, gateways, mail exchangers for part-time hosts, etc.

Vulnerability Detection Method

Details: `Check if Mailserver answer to VRFY and EXPN requests`
OID:1.3.6.1.4.1.25623.1.0.100072

NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Summary

It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
The service is only providing the deprecated TLSv1.0 protocol and supports one o
↪r more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report S
↪upported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.
```

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

. . . continues on next page . . .

. . . continued from previous page . . .

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols.
Please see the references for more resources supporting you with this task.

Affected Software/OS
- All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols
- CVE-2023-41928: Kiloview P1 4G and P2 4G Video Encoder
- CVE-2024-41270: Gorush v1.18.4
- CVE-2025-3200: Multiple products from Wiesemann & Theis

Vulnerability Insight
The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:
- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

Vulnerability Detection Method
Checks the used TLS protocols of the services provided by this system.
Details: `SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection`

Medium (CVSS: 4.3)

NVT: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)

Summary
This host is accepting 'RSA_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
'RSA_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5
TLS_RSA_EXPORT_WITH_RC4_40_MD5
'RSA_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5
TLS_RSA_EXPORT_WITH_RC4_40_MD5
```

Impact
Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

Solution:
Solution type: VendorFix
- Remove support for 'RSA_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task.
- If the service is using OpenSSL: Update to version 0.9.8zd, 1.0.0p, 1.0.1k or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

- Hosts accepting 'RSA_EXPORT' cipher suites.
- OpenSSL versions prior to 0.9.8zd, 1.0.0 prior to 1.0.0p and 1.0.1 prior to 1.0.1k.

Vulnerability Insight

Flaw is due to improper handling RSA temporary keys in a non-export RSA key exchange cipher suite.

Vulnerability Detection Method

Checks previous collected cipher suites.

Details: `SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)`

OID:1.3.6.1.4.1.25623.1.0.805142

↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
↪ng outside US,C=XX
Signature Algorithm:  sha1WithRSAEncryption
```

Solution:
Solution type: Mitigation

. . . continues on next page . . .

. . . continued from previous page . . .

Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:

- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.

NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:

Fingerprint1

or

fingerprint1, Fingerprint2

Vulnerability Detection Method

Check which hashing algorithm was used to sign the remote SSL/TLS certificate.

Details: `SSL/TLS: Certificate Signed Using A Weak Signature Algorithm`

OID:1.3.6.1.4.1.25623.1.0.105880

Version used: `2021-10-15T11:13:32Z`

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Server Temporary Key Size: 1024 bits
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:
Solution type: Workaround
- Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task.
- For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Affected Software/OS
All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.

Vulnerability Insight
The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method
Checks the DHE temporary public key size.
Details: `SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerabili.`

[return to 192.168.44.130]

2.1.15 Medium 23/tcp

Medium (CVSS: 4.8)

NVT: Telnet Unencrypted Cleartext Login

Summary
The remote host is running a Telnet service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
An attacker can uncover login names and passwords by sniffing traffic to the Telnet service.

Solution:
Solution type: Mitigation
Replace Telnet with a protocol like SSH which supports encrypted connections.

Vulnerability Detection Method
Details: `Telnet Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.108522
Version used: `2023-10-13T05:06:09Z`

2.1.16 Medium 5900/tcp

Medium (CVSS: 4.8)

NVT: VNC Server Unencrypted Data Transmission

Summary
The remote host is running a VNC server providing one or more insecure or cryptographically weak Security Type(s) not intended for use on untrusted networks.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The VNC server provides the following insecure or cryptographically weak Securit
↪y Type(s):
2 (VNC authentication)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact

An attacker can uncover sensitive data by sniffing traffic to the VNC server.

Solution:

Solution type: Mitigation

Run the session over an encrypted channel provided by IPsec [RFC4301] or SSH [RFC4254]. Some VNC server vendors are also providing more secure Security Types within their products.

Vulnerability Detection Method

Details: `VNC Server Unencrypted Data Transmission`

OID:1.3.6.1.4.1.25623.1.0.108529

[return to 192.168.44.130]

2.1.17 Medium 80/tcp

Medium (CVSS: 6.8)

NVT: TWiki Cross-Site Request Forgery Vulnerability (Sep 2010)

Summary

TWiki is prone to a cross-site request forgery (CSRF) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 01.Feb.2003
Fixed version:     4.3.2
```

Impact

Successful exploitation will allow attacker to gain administrative privileges on the target application and can cause CSRF attack.

Solution:

Solution type: VendorFix

Upgrade to TWiki version 4.3.2 or later.

Affected Software/OS

TWiki version prior to 4.3.2

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight

Attack can be done by tricking an authenticated TWiki user into visiting a static HTML page on another side, where a Javascript enabled browser will send an HTTP POST request to TWiki, which in turn will process the request as the TWiki user.

Vulnerability Detection Method

Details: `TWiki Cross-Site Request Forgery Vulnerability (Sep 2010)`
OID:1.3.6.1.4.1.25623.1.0.801281
Version used: `2024-03-01T14:37:10Z`

Medium (CVSS: 6.1)

NVT: jQuery < 1.9.0 XSS Vulnerability

Summary

jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 1.3.2
Fixed version:     1.9.0
Installation
path / port:       /mutillidae/javascript/ddsmoothmenu/jquery.min.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://192.168.44.130/mutillidae/javascript/ddsmoothmenu/jque
↪ry.min.js
- Referenced at:   http://192.168.44.130/mutillidae/
```

Solution:

Solution type: VendorFix

Update to version 1.9.0 or later.

Affected Software/OS

jQuery prior to version 1.9.0.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.9.0 XSS Vulnerability`

Medium (CVSS: 5.8)

NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled

Summary
The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
The web server has the following HTTP methods enabled: TRACE
```

Impact
An attacker may use this flaw to trick your legitimate web users to give him their credentials.

Solution:
Solution type: Mitigation
Disable the TRACE and TRACK methods in your web server configuration.
Please see the manual of your web server or the references for more information.

Affected Software/OS
Web servers with enabled TRACE and/or TRACK methods.

Vulnerability Insight
It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.

Vulnerability Detection Method
Checks if HTTP methods such as TRACE and TRACK are enabled and can be used.
Details: `HTTP Debugging Methods (TRACE/TRACK) Enabled`
OID:1.3.6.1.4.1.25623.1.0.11213

NVT: phpinfo() Output Reporting (HTTP)

Summary

Reporting of files containing the output of the phpinfo() PHP function previously detected via HTTP.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following files are calling the function phpinfo() which disclose potentiall
↪y sensitive information:
http://192.168.44.130/mutillidae/phpinfo.php
Concluded from:
  <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NOARCHIV
↪E" /></head>
  <tr><td class="e">Configuration File (php.ini) Path </td><td class="v">/etc/ph
↪p5/cgi </td></tr>
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
  <h2>PHP Core</h2>
  <h2>PHP Variables</h2>
http://192.168.44.130/phpinfo.php
Concluded from:
  <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NOARCHIV
↪E" /></head>
  <tr><td class="e">Configuration File (php.ini) Path </td><td class="v">/etc/ph
↪p5/cgi </td></tr>
  <h2>PHP Core</h2>
  <h2>PHP Variables</h2>
```

Impact

Some of the information that can be gathered from this file includes:
The username of the user running the PHP process, if it is a sudo user, the IP address of the host, the web server version, the system version (Unix, Linux, Windows, ...), and the root directory of the web server.

Solution:

Solution type: Workaround
Delete the listed files or restrict access to them.

Affected Software/OS

All systems exposing a file containing the output of the phpinfo() PHP function.
This VT is also reporting if an affected endpoint for the following products have been identified:
- CVE-2008-0149: TUTOS
- CVE-2023-49282, CVE-2023-49283: Microsoft Graph PHP SDK
- CVE-2024-10486: Google for WooCommerce plugin for WordPress

Vulnerability Insight

Many PHP installation tutorials instruct the user to create a file called phpinfo.php or similar containing the phpinfo() statement. Such a file is often left back in the webserver directory.

Vulnerability Detection Method

This script reports files identified by the following separate VT: 'phpinfo() Output Detection (HTTP)' (OID: 1.3.6.1.4.1.25623.1.0.108474).
Details: `phpinfo() Output Reporting (HTTP)`
OID:1.3.6.1.4.1.25623.1.0.11229

Medium (CVSS: 5.0)

NVT: QWikiwiki directory traversal vulnerability

Summary
The remote host is running QWikiwiki, a Wiki application written in PHP.
The remote version of this software contains a validation input flaw which may allow an attacker to use it to read arbitrary files on the remote host with the privileges of the web server.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
Vulnerable URL: http://192.168.44.130/mutillidae/index.php?page=../../../../../.
↪./../../../../../etc/passwd%00
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Vulnerability Detection Method
Details: `QWikiwiki directory traversal vulnerability`
OID:1.3.6.1.4.1.25623.1.0.16100
Version used: `2025-04-15T05:54:49Z`

References

```

Medium (CVSS: 5.0)

NVT: awiki <= 20100125 Multiple LFI Vulnerabilities - Active Check

Summary
awiki is prone to multiple local file include (LFI) vulnerabilities because it fails to properly sanitize user-supplied input.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
Vulnerable URL: http://192.168.44.130/mutillidae/index.php?page=/etc/passwd
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host.

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
awiki version 20100125 and prior.

Vulnerability Detection Method
Sends a crafted HTTP GET request and checks the response.
Details: `awiki <= 20100125 Multiple LFI Vulnerabilities - Active Check`
OID:1.3.6.1.4.1.25623.1.0.103210
Version used: `2025-04-15T05:54:49Z`

References
`url: https://www.exploit-db.com/exploits/36047/`
`url: http://www.securityfocus.com/bid/49187`

Medium (CVSS: 5.0)

NVT: /doc directory browsable

Summary
The /doc directory is browsable. /doc shows the content of the /usr/doc directory and therefore it shows which programs and - important! - the version of the installed programs.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`Vulnerable URL: http://192.168.44.130/doc/`

Solution:
Solution type: Mitigation
Use access restrictions for the /doc directory. If you use Apache you might use this in your access.conf:
<Directory /usr/doc> AllowOverride None order deny, allow deny from all allow from localhost </Directory>

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Details: `/doc directory browsable`
OID:1.3.6.1.4.1.25623.1.0.10056
Version used: `2023-08-01T13:29:10Z`

References

```
cve: CVE-1999-0678
url: http://www.securityfocus.com/bid/318
```

Medium (CVSS: 4.8)

NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary
The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following input fields were identified (URL:input name):
http://192.168.44.130/dvwa/login.php:password
http://192.168.44.130/phpMyAdmin/:pma_password
http://192.168.44.130/phpMyAdmin/?D=A:pma_password
http://192.168.44.130/tikiwiki/tiki-install.php:pass
http://192.168.44.130/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword
```

Impact
An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution:
Solution type: Workaround
Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

Affected Software/OS
Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

Vulnerability Detection Method
Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.
The script is currently checking the following:

. . . continues on next page . . .

. . . continued from previous page . . .

- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'

Details: `Cleartext Transmission of Sensitive Information via HTTP`

Medium (CVSS: 4.3)

NVT: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability

Summary
Apache HTTP Server is prone to a cookie information disclosure vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow attackers to obtain sensitive information that may aid in further attacks.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server version 2.2.22 or later.

Affected Software/OS
Apache HTTP Server versions 2.2.0 through 2.2.21.

Vulnerability Insight
The flaw is due to an error within the default error response for status code 400 when no custom ErrorDocument is configured, which can be exploited to expose 'httpOnly' cookies.

Vulnerability Detection Method
Details: `Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.902830
Version used: `2025-03-05T05:38:53Z`

Medium (CVSS: 4.3)

NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability

Summary
phpMyAdmin is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
phpMyAdmin version 3.3.8.1 and prior.

Vulnerability Insight
The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Vulnerability Detection Method
Details: `phpMyAdmin 'error.php' Cross Site Scripting Vulnerability`

Medium (CVSS: 4.3)

NVT: jQuery < 1.6.3 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 1.3.2
Fixed version:     1.6.3
Installation
path / port:       /mutillidae/javascript/ddsmoothmenu/jquery.min.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://192.168.44.130/mutillidae/javascript/ddsmoothmenu/jque
↪ry.min.js
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
- Referenced at:   http://192.168.44.130/mutillidae/
```

Solution:
Solution type: VendorFix
Update to version 1.6.3 or later.

Affected Software/OS
jQuery prior to version 1.6.3.

Vulnerability Insight
Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.6.3 XSS Vulnerability`

0x30:  5F 4F 70 65 6E 56 41 53                            _OpenVAS
```

Impact
An attacker may leverage this issue to execute arbitrary shell commands on an affected system with the privileges of the application.

Solution:
Solution type: VendorFix
Updates are available. Please see the referenced vendor advisory.

Affected Software/OS
Samba versions 3.0.0 through 3.0.25rc3.

Vulnerability Detection Method
Sends a crafted SMB request and checks if the target is connecting back to the scanner host.
Note: For a successful detection of this flaw the scanner host needs to be able to directly receive ICMP echo requests from the target.
Details: `Samba 3.0.0 <= 3.0.25rc3 MS-RPC Remote Shell Command Execution Vulnerability - .`
`↪..`

2.1.19 Low 22/tcp

Low (CVSS: 2.6)

NVT: Weak MAC Algorithm(s) Supported (SSH)

Summary
The remote SSH server is configured to allow / support weak MAC algorithm(s).

Quality of Detection (QoD): 80%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
The remote SSH server supports the following weak client-to-server MAC algorithm
↪(s):
hmac-md5
hmac-md5-96
hmac-sha1-96
umac-64@openssh.com
The remote SSH server supports the following weak server-to-client MAC algorithm
↪(s):
hmac-md5
hmac-md5-96
hmac-sha1-96
umac-64@openssh.com
```

Solution:
Solution type: Mitigation
Disable the reported weak MAC algorithm(s).

Vulnerability Detection Method

Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak MAC algorithms are defined as the following:
- MD5 based algorithms
- 96-bit based algorithms
- 64-bit based algorithms
- 'none' algorithm

Details: `Weak MAC Algorithm(s) Supported (SSH)`
OID:1.3.6.1.4.1.25623.1.0.105610
Version used: `2024-06-14T05:05:48Z`

2.1.20 Low 5432/tcp

Low (CVSS: 3.4)

NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

This host is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution:
Solution type: Mitigation
Possible Mitigations are:
- Disable SSLv3
- Disable cipher suites supporting CBC cipher modes
- Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+

Vulnerability Insight
The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code

Vulnerability Detection Method
Evaluate previous collected information about this service.
Details: `SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability .`

[return to 192.168.44.130]

2.1.21 Low general/tcp

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 196684
Packet 2: 196792
```

Impact
A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:
Solution type: Mitigation
To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.
To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'
Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.
The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.
See the references for more information.

Affected Software/OS
TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight
The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method

Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.

Details: `TCP Timestamps Information Disclosure`

OID:1.3.6.1.4.1.25623.1.0.80091

Version used: `2023-12-15T16:10:08Z`

[return to 192.168.44.130]

2.1.22 Low 25/tcp

Low (CVSS: 3.7)

NVT: SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam)

Summary

This host is accepting 'DHE_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
```

Impact

Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
- Remove support for 'DHE_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task.
- If the service is using OpenSSL: Update to version 1.0.1n, 1.0.2b or later.

Affected Software/OS
- Hosts accepting 'DHE_EXPORT' cipher suites.
- OpenSSL versions prior to 1.0.1n and 1.0.2 prior to 1.0.2b.

Vulnerability Insight
Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.

Vulnerability Detection Method
Checks previous collected cipher suites.

Low (CVSS: 3.4)

NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)

Summary
This host is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution:
Solution type: Mitigation
Possible Mitigations are:
- Disable SSLv3
- Disable cipher suites supporting CBC cipher modes
- Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code

Vulnerability Detection Method

Evaluate previous collected information about this service.

[return to 192.168.44.130]

2.1.23 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

Summary
The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
The following response / ICMP packet has been received:
- ICMP Type: 14
- ICMP Code: 0
```

Impact

This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:

Solution type: Mitigation

Various mitigations are possible:

- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight

The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method

Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.

Details: `ICMP Timestamp Reply Information Disclosure`
